

When did the Sun rise today? When did it set? Ever wonder why it is dark outside at night, and why the Sun is up during the day? This is because the Earth spins around the Sun.

Half of our planet is always facing the Sun, making daylight. The other half of the planet faces away from the Sun, which means that it is nighttime for that side of Earth.

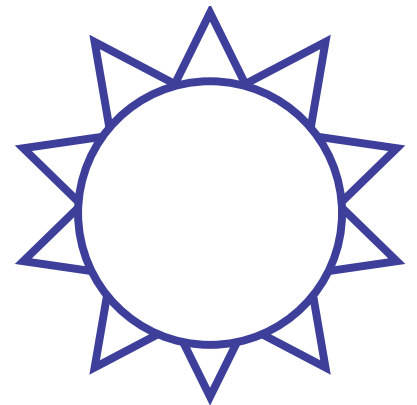

Look at the picture below. Do you see how the Earth faces the Moon and the Sun? With a yellow crayon, colour the half of the planet and the moon that is covered in daylight. With a black crayon, colour in night time.

MOON

EARTH

SUN
